ABSTRACTED-PUB-NO: US 5991749A
BASIC-ABSTRACT:

NOVELTY - A service provider's CPU processes account and authorization information, in response to function code entered by user on keypad of cellular phone. The service provider CPU identifies desired transaction and supplies personal ID number if needed. The desired transaction is authorized to determine different accounts involved and confirms completion of transaction.

DETAILED DESCRIPTION - The desired transaction involves a default amount at preset price and variable amount. An INDEPENDENT CLAIM is also included for a method for verifying identity and authorizing access to secured location.

USE - For collecting tolls of cellular telephones, electronic wallet, wireless PIN pad, contactless smart card, etc.

ADVANTAGE - Highly reliable and simple technique provides desirable results since an unauthorized user with closed cellular phone would need to know unique function code, account number and personal identification number (PIN) to complete the transaction and generate a confirmation number and thus transactions of unauthorized users are not performed.

DESCRIPTION OF DRAWING(S) - The figure shows the chart of the steps involved in computer tolling procedure.

ABSTRACTED-PUB-NO: US 5689100A
BASIC-ABSTRACT:

The debit card system includes numerous debit cards, each assigned to one participant and having a unique account number corresponding to an award account of the participant. A bank filter processor accesses program data including data identifying the authorized unique account numbers of the participants, the authorized merchants and the balance in each participant's award account.

The filter processor compares this program data to the following transaction data: the initiating account number of the card initiating the transaction, the merchant identification data of the initiating merchant, and the data regarding the amount of the initiated transaction. The filter processor generates validating data for the transaction when the evaluated transaction data indicates that the transaction has been initiated by an authorized merchant using the unique account number of one of the participants having a sufficient balance in their award account to cover the transaction. Otherwise, invalidating data is generated.

ADVANTAGE - Eliminates or minimises paperwork associated with transactions by which participants obtain rewards and track such earnings, redemption and accounts. Allows use of debit cards rather than credit cards.
